The 2012 Class EA considered a local sewage treatment plant but concluded that the preferred sewage treatment option was to create a pipeline and pump sewage to the Angus Centre Street Sewage Treatment Plant (STP). Brookfield completed the detailed engineering for the Sewage Pumping Station and forcemain, and found that the required design is complex and expensive to build, operate and maintain. In addition, a variety of new STP technologies are now available. The amendment to the Class EA is being undertaken to consider the new information.

The draft Phase 2 Report concludes that the construction of a local sewage treatment plant using a “package plant” approach is the Preferred Alternative. The plant would discharge treated effluent to the Nottawasaga River or the North tributary. The Angus STP also discharges to the Nottawasaga River. A sewer system will be constructed to collect sewage from the houses and bring it to a central location.

The plans for the drinking water supply will remain the same as today.

Do you have any concerns regarding the construction of a local sewage treatment plant?

(Please complete other side of form)

Do you have any concerns regarding the construction of the sanitary sewer system?

Do you have any other concerns about this proposed project that you would like to bring to our attention?

Do you want us to contact you to discuss your concerns?

Yes _____ No, adequately addressed at meeting _____

If yes, please provide address below
